The nature of the cracking process is explained by simple physical considerations. The observation from practice, that the cracking process is made more difficult with thin wall thicknesses, with poorly cooled glasses and with small tubes, finds its deeper reason thereby. (Author)

Flames in glass furnaces can be photographed with relatively simple aids. When working rapidly it is sufficient to have a protective screen for the camera. Color films produce more contrasty pictures than black-and-white films, especially when a light blue filter is used. The exposure times ought to be as brief as possible. Rapidly streaming flames, such as oil flames, require exposures of 1/1000 second and less in order to prevent blurring due to movement. The lens opening should be selected in accordance with the nature and the brightness of the flame. (Author)
